

DATA QUALITY OF GHG INVENTORIES - EACH STEP AHEAD MATTERS!

- Do you want to establish an **efficient ghg monitoring** system for your multinational operations (e.g. within a corporation, association, international or governmental organisation)?
- Are you responsible for quality assurance / quality control of a national ghg inventory report following the IPCC 2006 guidelines and you want to apply the recommended approach of **external audits**?
- Does your country's NDCs need to be substantiated by transparent, high quality data and your intention is to build **in-country capacities** in monitoring, reporting and verification (MRV) of ghg emissions, sinks and reductions?
- Does your understanding of **sustainable development** include the creation of local resources, the improving of education and a demand for knowledgeable local personnel?
- Do you want to ensure that your investments in climate change mitigation, in the set-up of new organizational structures or costly ghg data bases deliver **measurable and transparent results**?
- Do you take care that the development of a local carbon market for ghg verifiers including a robust accreditation scheme is made at **reasonable costs** and results in a globally accepted scheme?

If so, you have good reasons to consider our services delivered by a team of experts with an unrivalled competence in MRV of greenhouse gases at corporate, sectoral and national level.

OUR COMPETENCE – MRV OF GHG

We from verico SCE (Societas Cooperativa Europaea), a European cooperative, based in Freising, Germany, run a unique organisational structure among all accredited verification bodies. Our members from several EU member countries are all small enterprises and freelancers. We use the legal form of a cooperative to provide accredited services and to provide a platform for multi-sectoral services. As members we are all owners of verico SCE and every one of us has an inherent interest in delivering high-quality services that exceed the clients' expectations.

OUR COMPETENCE - YOUR BENEFIT

All members of verico SCE can refer to **decades of experiences** as experts in various industries, as ghg verifiers, in quality assurance, accreditation and as trainers/coaches. This comprehensive competence enables us to offer authorities services such as the auditing of quality control measures or assistance in applying the provisions of MRV in a new carbon market or carbon tax system.

Capacity building measures, such as a “train the trainers” concept to develop local resources, **support the successful implementation** and acceptance of such schemes. A PDCA (plan-do-check-act) concept can be implemented from the outset allowing a higher tier of ghg reporting to be achieved at corporate, sectoral or national level and instituting continuous improvement milestones at an early stage. We know what we are talking about, when it comes to ghg emissions in energy generation, industrial operations, agriculture, forestry and the waste sector.

Make use of this expertise. Ensure that your investments in monitoring emissions, collecting and reporting data, creating and supervising verifier capacities are made in a **reasonable, complete** and **cost-efficient** manner.
